

Overview

Qwo® is the first and only FDA-approved injectable for the treatment of moderate to severe cellulite in the buttocks of adult women.¹

Together, there are three things that cause cellulite's signature dimples: over time, skin thins, fat cells enlarge and push against the skin, and the fibrous bands under the skin's surface thicken and cause tension.

How QWO Works

QWO is made from enzymes called collagenases. These enzymes are thought to target the structural causes under the skin, where cellulite starts. It's thought that QWO works by releasing fibrous bands, redistributing fat cells, and stimulating the growth of new collagen. How QWO works in moderate to severe cellulite is not fully understood.

QWO Clinical Data

Endo Aesthetics conducted the largest clinical trials in the history of cellulite investigation to help determine the safety and efficacy of QWO. These two identical trials enrolled 845 women in the United States, aged 18 or older, with moderate to severe cellulite in the buttocks. Reductions in cellulite severity were observed more frequently in the QWO group compared to the placebo group as measured by the investigator and patient cellulite severity scales.¹

Availability

QWO will be available throughout the United States at aesthetic healthcare practitioners' offices starting in spring 2021. Please speak with your aesthetic healthcare practitioner for more information.

QWO Quick Facts

- Injections take about 10 minutes or less.
- Three treatment visits over the course of two months.
- Studied on all skin types and ethnicities.
- QWO may cause serious allergic reactions, including anaphylaxis, and injection site bruising. Please see Important Safety Information on the next page for more details.

WHAT IS QWO?

QWO is a prescription medicine used to treat moderate to severe cellulite in the buttocks of adult women.

IMPORTANT SAFETY INFORMATION

Do not receive QWO if you: are allergic to collagenase or to any of the ingredients in QWO, or have an active infection at the treatment area.

QWO may cause serious side effects, including:

- **Allergic (hypersensitivity) reactions, including anaphylaxis.** Call your healthcare provider right away if you have hives, trouble breathing, low blood pressure, swollen face, chest pain, dizziness or fainting after receiving QWO;
- **Injection site bruising**

Before receiving QWO, tell your healthcare provider if you:

- have a bleeding problem
- are pregnant or may become pregnant, nursing or plan to nurse. You and your healthcare provider should decide if you will receive QWO or breastfeed.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins and herbal supplements. **Especially tell your healthcare provider if you take** a medicine that prevents the clotting of your blood (antiplatelet or anticoagulant).

The most common side effects of QWO include: injection site bruising, pain, areas of hardness, itching, redness, discoloration, swelling and warmth in the treatment area.

These are not all the possible side effects of QWO. Call your healthcare provider for medical advice about side effects. You are encouraged to report side effects of prescription drugs to the FDA at www.fda.gov/medwatch or 1-800-FDA-1088.
